Lecture 4

PREFIX SUM ARRAY DIFFERENCE ARRAY

Prefix Sum Array – Problem

- Given an array of N integers, do the following operation Q times:
- Output the sum of all elements from indexes L through R , inclusive (not necessarily the same each time).

Prefix Sum Array – Problem

- Standard approach:
 - For each operation, use a for loop from indexes L through R , inclusive
 - Use a variable to keep track of sum
 - Output sum variable

Prefix Sum Array – Problem

- What is the worst case?
 - Every time, we must output the sum of the entire array.
 - Runtime: $O(NQ)$

Prefix Sum Array – Solution

- Can we manipulate the array to speed up our operations?
- Note that the array elements themselves do not change (or transfer to another array).

Prefix Sum Array – Solution

- Let $pre[i] = ar[0]+ar[1]+\dots+ar[i]$
- How do we compute the sum from L through R , inclusive?
 - $pre[R]-pre[L-1]$
 - $pre[R] = ar[0]+ar[1]+\dots+ar[R]$
 - $pre[L-1] = ar[0]+ar[1]+\dots+ar[L-1]$
 - So, $pre[R]-pre[L-1] = ar[L]+ar[L+1]\dots+ar[R]$

Prefix Sum Array - Generation

- How do we generate $pre[i]$?
- $pre[0] = ar[0]$
- $pre[1] = ar[0]+ar[1]$
- $pre[1] = pre[0]+ar[1]$
- $pre[2] = ar[0]+ar[1]+ar[2]$
- $pre[2] = pre[1]+ar[2]$
- Therefore, $pre[i] = pre[i-1]+ar[i]$
- Use the sum previous PS value and the current element to get current PS value.

Prefix Sum Array - Example

- Array:

1	5	9	2	3	8	10	7	4	6
---	---	---	---	---	---	----	---	---	---

- Prefix Sum Array:

1	6	15	17	20	28	38	45	49	55
---	---	----	----	----	----	----	----	----	----

- Queries:

- Sum from indexes 0 through 9
 - 55
- Sum from indexes 1 through 6
 - 37
- Sum from indexes 3 through 7
 - 30

Prefix Sum Array - Pseudocode

```
int ar[], pre[];  
//get ar values  
  
//generate prefix sum array  
pre[0] = ar[0];  
for (int i = 1; i < ar.size; i++){  
    pre[i] = pre[i-1]+ar[i];  
}  
  
//query  
for (each query (L,R)){  
    print pre[R] - pre[L-1];  
}
```

Prefix Sum Array – Runtime

- Query (operation): $O(1)$
 - We only need to access 2 positions in the PS array for each query
- Update (change values): $O(N)$
 - PS array must be rebuilt

Difference Array – Problem

- Given an array of N integers, do the following operation Q times:
- Add an amount, C , to all elements from indexes L through R , inclusive
- Output the array after all operations are done

Difference Array – Problem

- Standard approach:
 - For each operation, use a for loop from indexes L through R , inclusive
 - Add C to every element in the range

Difference Array – Problem

- What is the worst case?
 - Every time, we must update the entire array.
 - Runtime: $O(NQ)$

Difference Array – Solution

- Keep track of the differences between each element.
- $diff[0] = ar[0]$
 - We need this so that we know the initial value
- for each ($i > 0$) $diff[i] = ar[i]-ar[i-1]$

Difference Array – Recovery

- How do we retrieve the state of the array if we have the difference array?
- Note that the prefix sum array of the difference array is the original array itself
- Therefore, run the prefix sum array algorithm on the difference array to retrieve final state of the array

Difference Array – Example

- Why do we want to keep track of differences?
- Let's take a look at some examples:
- Original Array:

1	1	1	1	1	1	1	1	1	1
---	---	---	---	---	---	---	---	---	---

- Difference Array:

1	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---

Difference Array – Example

- Difference Array:

1	0	0	2	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---

- Original Array:

1	1	1	3	3	3	3	3	3	3
---	---	---	---	---	---	---	---	---	---

- Elements from index 3 and onward are all changed by the single changed value in the difference array

Difference Array – Example

- Difference Array:

1	0	0	2	0	0	0	-2	0	0
---	---	---	---	---	---	---	----	---	---

- Original Array:

1	1	1	3	3	3	3	1	1	1
---	---	---	---	---	---	---	---	---	---

- Elements from index 7 and onward are all changed by the same value.
- We have effectively added 2 to indexes 3 through 6, but only 2 operations are required

Difference Array – Example

- Difference Array:

1	0	0	2	0	5	0	-2	0	0
---	---	---	---	---	---	---	----	---	---

- Original Array:

1	1	1	3	3	8	8	6	6	6
---	---	---	---	---	---	---	---	---	---

Difference Array – Example

- Difference Array:

1	0	0	2	0	5	0	-2	0	-5
---	---	---	---	---	---	---	----	---	-----------

- Original Array:

1	1	1	3	3	8	8	6	6	1
---	---	---	---	---	---	---	---	---	----------

Difference Array – Pseudocode

```
int ar[],diff[];  
//get ar[] values  
//generate difference array  
diff[0] = ar[0];  
for (int i = 1; i < ar.size; i++)  
    diff[i] = ar[i]-ar[i-1];  
  
//query  
for (each query (L,R,C)){  
    diff[L] += C;  
    diff[R+1] -= C;  
}  
//generate final array  
ar[0] = diff[0];  
for (int i = 1; i < ar.size; i++)  
    ar[i] = ar[i-1]+diff[i];
```

Difference Array – Runtime

- Update (change values): $O(1)$
 - Only 2 elements need to be updated
- Query (get actual value): $O(N)$
 - Difference array must be changed into normal array using PSA algorithm

Comparison to Calculus

- Prefix sum array is integration
- Difference array is differentiation

Multi-Dimensional PSA

- Start with 2-D PSA, 3-D will be easy to understand once 2-D is understood
- Let $pre[row][col]$ be the sum of all elements in the rectangle with corners $(1,1)$ and (row,col)
- $\text{row} = 3, \text{col} = 4$

	1	2	3	4	5
1	■	■	■	■	
2	■	■	■	■	
3	■	■	■	■	■
4					
5					

Multi-Dimensional PSA - Generation

- How can we generate the PSA value for (row, col)?
- $pre[row][col] = red + green$
- Green area is the value in the original array
- So, how do we get the sum of values in the red area?

	1	2	3	4	5
1					
2					
3					
4					
5					

Multi-Dimensional PSA - Generation

- Combine the sum of the two yellow areas in the tables to the right
- First yellow area:
 - $pre[row-1][col]$
- Second yellow area:
 - $pre[row][col-1]$

	1	2	3	4	5
1	Yellow	Yellow	Yellow	Yellow	
2	Yellow	Yellow	Yellow	Yellow	
3	Red	Red	Red	Green	
4					
5					

	1	2	3	4	5
1	Yellow	Yellow	Yellow	Red	
2	Yellow	Yellow	Yellow	Red	
3	Yellow	Yellow	Yellow	Green	
4					
5					

Multi-Dimensional PSA - Generation

- However, if we add the two yellow areas together, the dark yellow area is counted twice
- Therefore, we must subtract it from the sum.
- Dark yellow area:
 - $pre[row-1][col-1]$

	1	2	3	4	5
1					
2					
3					
4					
5					

Multi-Dimensional PSA - Generation

- Combining all of this, we get:

$pre[row][col] =$

$$ar[row][col] + pre[row-1][col]$$
$$+ pre[row][col-1] - pre[row-1][col-1]$$

	1	2	3	4	5
1					
2					
3					
4					
5					

- Note that I used 1-based arrays since dealing with out of bound errors can be annoying.

Multi-Dimensional PSA - Query

- Now that we have generated the 2-D PSA, we want to be able to get the sum of all values within a boundary
- What is the sum of values in the red area? We are given corners (5,5) and (3,2).

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Multi-Dimensional PSA – Query

- Remember PSA only remembers sum from (1,1) to (row,col).
- Thus, we want:
pre[5][5]-green area
- How do we get the sum of values in the green area?

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Multi-Dimensional PSA - Query

- Combine the two yellow rectangles

	1	2	3	4	5	6
1	Yellow					
2	Yellow					
3	Green	Red	Red	Red	Red	
4	Green	Red	Red	Red	Red	
5	Green	Red	Red	Red	Red	
6						

	1	2	3	4	5	6
1	Yellow		Green	Green	Green	
2	Yellow		Green	Green	Green	
3	Yellow		Red	Red	Red	
4	Yellow		Red	Red	Red	
5	Yellow		Red	Red	Red	
6						

Multi-Dimensional PSA - Query

- Remember that the dark yellow area is counted twice, so we must subtract it once.

	1	2	3	4	5	6
1	Dark Yellow	Yellow	Yellow	Yellow	Yellow	Yellow
2	Dark Yellow	Yellow	Yellow	Yellow	Yellow	Yellow
3	Yellow	Red	Red	Red	Red	Red
4	Yellow	Red	Red	Red	Red	Red
5	Yellow	Red	Red	Red	Red	Red
6						

Multi-Dimensional PSA - Query

Combining all of this, we get:

Let $(r1, c1)$ be the top-left corner

Let $(r2, c2)$ be the bottom-right corner

$$\text{Sum}(r1, c1, r2, c2) = \text{pre}[r2][c2] - \text{green}$$

$$\text{green} = \text{yellow1} + \text{yellow2} - \text{darkyellow}$$

$$\text{yellow1} = \text{pre}[r1-1][c2]$$

$$\text{yellow2} = \text{pre}[r2][c1-1]$$

$$\text{darkyellow} = \text{pre}[r1-1][c1-1]$$

$$\text{Sum}(r1, c1, r2, c2) = \text{pre}[r2][c2] - (\text{pre}[r1-1][c2] + \text{pre}[r2][c1-1] - \text{pre}[r1-1][c1-1])$$

$$\begin{aligned} \text{Sum } (r1, c1, r2, c2) &= \text{pre}[r2][c2] \\ &- \text{pre}[r1-1][c2] - \text{pre}[r2][c1-1] \\ &+ \text{pre}[r1-1][c1-1] \end{aligned}$$

	1	2	3	4	5	6
1	green				green	
2		green			green	
3	green		red	red	red	
4		green	red	red	red	
5	green		red	red	red	
6			red	red	red	

	1	2	3	4	5	6
1	green				green	
2	green				green	
3	yellow		red	red	red	
4	yellow		red	red	red	
5	yellow		red	red	red	
6			red	red	red	

Multi-Dimensional DA – Generation

- We can use the properties of PSA Generation in order to determine what we need to do in order to generate a DA from an array.
- **Remember that the PSA of a DA is the original array.**

Multi-Dimensional DA – Generation

- ◎ The PSA of a DA is the original array.
- ◎ Let $pre2 = ar$; $ar2 = diff$

Remember,

$$pre2[row][col] =$$

$$ar2[row][col] + pre2[row-1][col]$$

$$+ pre2[row][col-1] - pre2[row-1][col-1]$$

Multi-Dimensional DA – Generation

- ◎ $pre2 = ar, ar2 = diff$

$$pre2[row][col] = ar2[row][col] + pre2[row-1][col] \\ + pre2[row][col-1] - pre2[row-1][col-1]$$

- ◎ Substitute:

$$ar[row][col] = diff[row][col] + ar[row-1][col] \\ + ar[row][col-1] - ar[row-1][col-1]$$

- ◎ Rearrange:

$$diff[row][col] = ar[row][col] + ar[row-1][col-1] \\ - ar[row-1][col] - ar[row][col-1]$$

Multi-Dimensional DA - Generation

$$\begin{aligned} \text{diff}[row][col] &= \text{ar}[row][col] + \text{ar}[row-1][col-1] \\ &\quad - \text{ar}[row-1][col] - \text{ar}[row][col-1] \end{aligned}$$

- This makes sense since we are trying to find a number (green) where when added to other values in the DA will produce the original value.

	1	2	3	4	5
1					
2					
3					
4					
5					

Multi-Dimensional DA - Update

- Based on how PSA is made, if $diff[3][2]$ is changed, the entire red area in the original array is changed.
- The region is from (row, col) to (max_row,max_col)

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Multi-Dimensional DA – Update

- We want to update the green region without updating the red region.
- If we update from $diff[3][2]$, the entire colored region becomes updated. Thus, we must “unupdate” the red region, or subtract what was added to $diff[3][2]$.

	1	2	3	4	5	6
1						
2						
3			green	green	green	red
4			green	green	green	red
5		red	red	red	red	red
6		red	red	red	red	red

Multi-Dimensional DA – Update

- We can unupdate the two yellow regions shown below.
- In this example, subtract what was added to $diff[3][2]$ from $diff[5][2]$ and $diff[3][6]$.

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Multi-Dimensional DA – Update

- However, the dark yellow region was unupdated twice. Therefore, we must update the yellow region.

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Multi-Dimensional DA – Update

- Therefore, if we need to add C to a region $(r1, c1, r2, c2)$
- Add C to $diff[r1][c1]$
- Subtract C from $diff[r2+1][c1]$
- Subtract C from $diff[r1][c2+1]$
- Add C to $diff[r2+1][c2+1]$

	1	2	3	4	5	6
1						
2						
3						
4						
5						
6						

Higher-Dimension PSA and DA

- Use the concepts similar to 2-D versions in order to implement higher dimensions.
- For example, use a cube for 3-D PSAs and DAs.

THANK YOU!
